Security Design & Management

The Right Security Solutions For Your Business

One of the challenges that every business faces is protecting the business and its assets. Protection can be external physical security measures such as locks and alarms, or internal logical security measures such as procedures controlling access to sensitive company information. Whatever the size and nature of the business there is always something of value that requires securing. In today's business world most companies rely on Information Technology for some function of their business. As with other areas of the business, IT requires securing both physically and logically.

The targeting of data through IT networks and systems is not just restricted to enterprise businesses with 'high value data'. According to studies, 87% of small/medium businesses have experienced a security breach in the last 12 months, up from 56% in 2005. Approximately 33% of small/medium businesses experienced some business disruption due to security incidents. The source of these security incidents isn't always external, law enforcement reports indicate that internal attacks occur almost as often as external attacks, therefore IT security has to focus on internal network security as much as perimeter defense. Now there is another element for some businesses to consider, regulatory compliance. Depending on the nature or location of your business, legal regulations may apply. So for some IT security is no longer a choice, but for all it should be a priority.

Security Design & Management Services

P4 Performance Management has a solution for customers who want to apply the same security solutions used by enterprise businesses and governments but at a cost that fits their budget. The P4secureSM service provides a suite of security solutions tailored to your needs and packaged in an à la carte selection to enable business managers to select the services they need, as they need them. P4secureSM features innovative professional services consultancy provided by experienced, certified P4 Security Solution experts and backed by our Global Security Operations Center (GSOCSM). Our solutions offer customers of all sizes, enterprise grade professional security consulting services.

Service Offering

For customers who already have an IT security architecture in place, P4 can offer design and management services to help you maximize your investment. Anyone can purchase and deploy a network security solution such as a firewall or intrusion detection and prevention system, but if the device is not configured and managed correctly it can quickly become ineffective. The benefits of selecting managed security services such as P4secureSM Security Design and Management Services include:

- ▶ A level of comfort in knowing that should a security incident occur, our Security and Operations Teams will work to manage and mitigate the threat.
- ▶ Our experience and expertise in network and systems security, combined with our knowledge and research of known threats and vulnerabilities, ensure that your security solutions are maintained and configured to be their most effective.
- ▶ Through the implementation of proven security policies and procedures we can ensure that your network systems are hardened and that the introduction of change to the environment is managed to reduce risk and maintain integrity and security.

Given the severity of today's IT security threats, the impact of penetration to your business and the prohibitive cost of providing and maintaining an effective level of security, the value of P4's Security Design and Management Services is evident. Where regulatory compliance is a concern, knowing that your security architecture is supported and managed by industry qualified experts helps alleviate the stress of preparing for and passing independent audits.
